

Effects of Basic Wind and CAPE on Orographic Precipitation in a Conditionally Unstable Uniform Flow

Gökhan Sever and Yuh-Lang Lin (ylin@ncat.edu), Dept. of Energy and Environment Systems, NC A&T State University

A series of systematic 2D/3D idealized numerical experiments were conducted to investigate the combined effects of dynamical and physical processes on orographic precipitation (OP) with varying incoming basic flow speed (U) and CAPE in a conditionally unstable uniform flow for the atmospheric environments similar to tropical cyclones and supercell storms.
